Machine learning has been applied to a vast number of problems in many contexts, beyond the typical statistics problems. Machine learning is often designed with different considerations than statistics (e.g., speed is often more important than accuracy). Often, machine learning methods are broken into two phases: 1.

Understanding Machine Learning: From Theory to Algorithms ... large scale learning (a.k.a. Big Data"), since in recent years, our world has be- ... a machine learn". We quantify the amount of data needed for learning using the ERM, SRM, and MDL rules and show how learning might fail by deriving.

### **Understanding Machine Learning: From Theory to Algorithms**

At its core, machine learning is a mathematical, algorithm-based technology that forms the basis of historical data mining and modern big data science. Scientific analysis of big data requires a working knowledge of machine learning, which forms predictions based on known properties learned from training data.

proach to machine learning: a learning algorithm reads in training data and computes a learned function  $f$ . This function can then automatically label future text examples. To make this concrete, Figure?? shows the general framework of induction. We are given training data on which our algorithm is expected to learn.

2. What is Machine Learning? "Optimizing a performance criterion using example data and past experience", said by E. Alpaydin [8], gives an easy but faithful description about machine learning. In machine learning, data plays an indispensable role, and the learning algorithm is used to discover and learn knowledge or properties from the data.

Machine learning algorithms can figure out how to perform important tasks by generalizing from examples. This is often feasible and cost-effective where manual programming is not. As more data becomes available, more ambitious problems can be tackled. As a result, machine learning is widely used in computer science and other fields. However,
