

rna trafficking and nuclear pdf

The dynamic and reversible N 6-methyladenosine (m 6 A) RNA modification installed and erased by N 6-methyltransferases and demethylases regulates gene expression and cell fate. We show that the m 6 A demethylase ALKBH5 is highly expressed in glioblastoma stem-like cells (GSCs). Silencing ALKBH5 suppresses the proliferation of patient-derived GSCs. Integrated transcriptome and m 6 A-seq analyses ...

m6A Demethylase ALKBH5 Maintains Tumorigenicity of

Gene expression is the process by which information from a gene is used in the synthesis of a functional gene product. These products are often proteins, but in non-protein coding genes such as transfer RNA (tRNA) or small nuclear RNA (snRNA) genes, the product is a functional RNA.. The process of gene expression is used by all known life "eukaryotes (including multicellular organisms ...

Gene expression - Wikipedia

Neurofibromin 1 (NF1) is a gene in humans that is located on chromosome 17. NF1 codes for neurofibromin, a GTPase-activating protein that negatively regulates RAS/MAPK pathway activity by accelerating the hydrolysis of Ras-bound GTP. There are currently five known neurofibromin isoforms that are expressed in different tissues and perform different functions.

Neurofibromin 1 - Wikipedia

Structure Matters. Whether an RNA targeting oligonucleotide is single or double stranded has a considerable influence on performance. ASOs are single stranded, while siRNAs are double stranded, containing a sense and an antisense strand (Figure 2C). In an siRNA, the antisense strand is the pharmacologically active moiety and the sense strand can be considered a "drug delivery device" that ...

Mobilizing the immune system via blockade of immune cell inhibitory pathways is revolutionizing oncology clinical practice. Multiple monotherapy agents have been approved and combination therapies are in development. This review discusses key intracellular pathways where development of small-molecule therapeutics is attractive, tractable, and synergistic with biologic-mediated checkpoint blockade.

Small-Molecule Targets in Immuno-Oncology: Cell Chemical

The mechanism whereby members of the order Picornvirales specifically package their genomic RNAs is poorly understood. Research with monopartite members of the order, such as poliovirus, indicated that packaging is linked to replication, although the presence of "packaging signals" along the length of the viral RNA has also been suggested.
